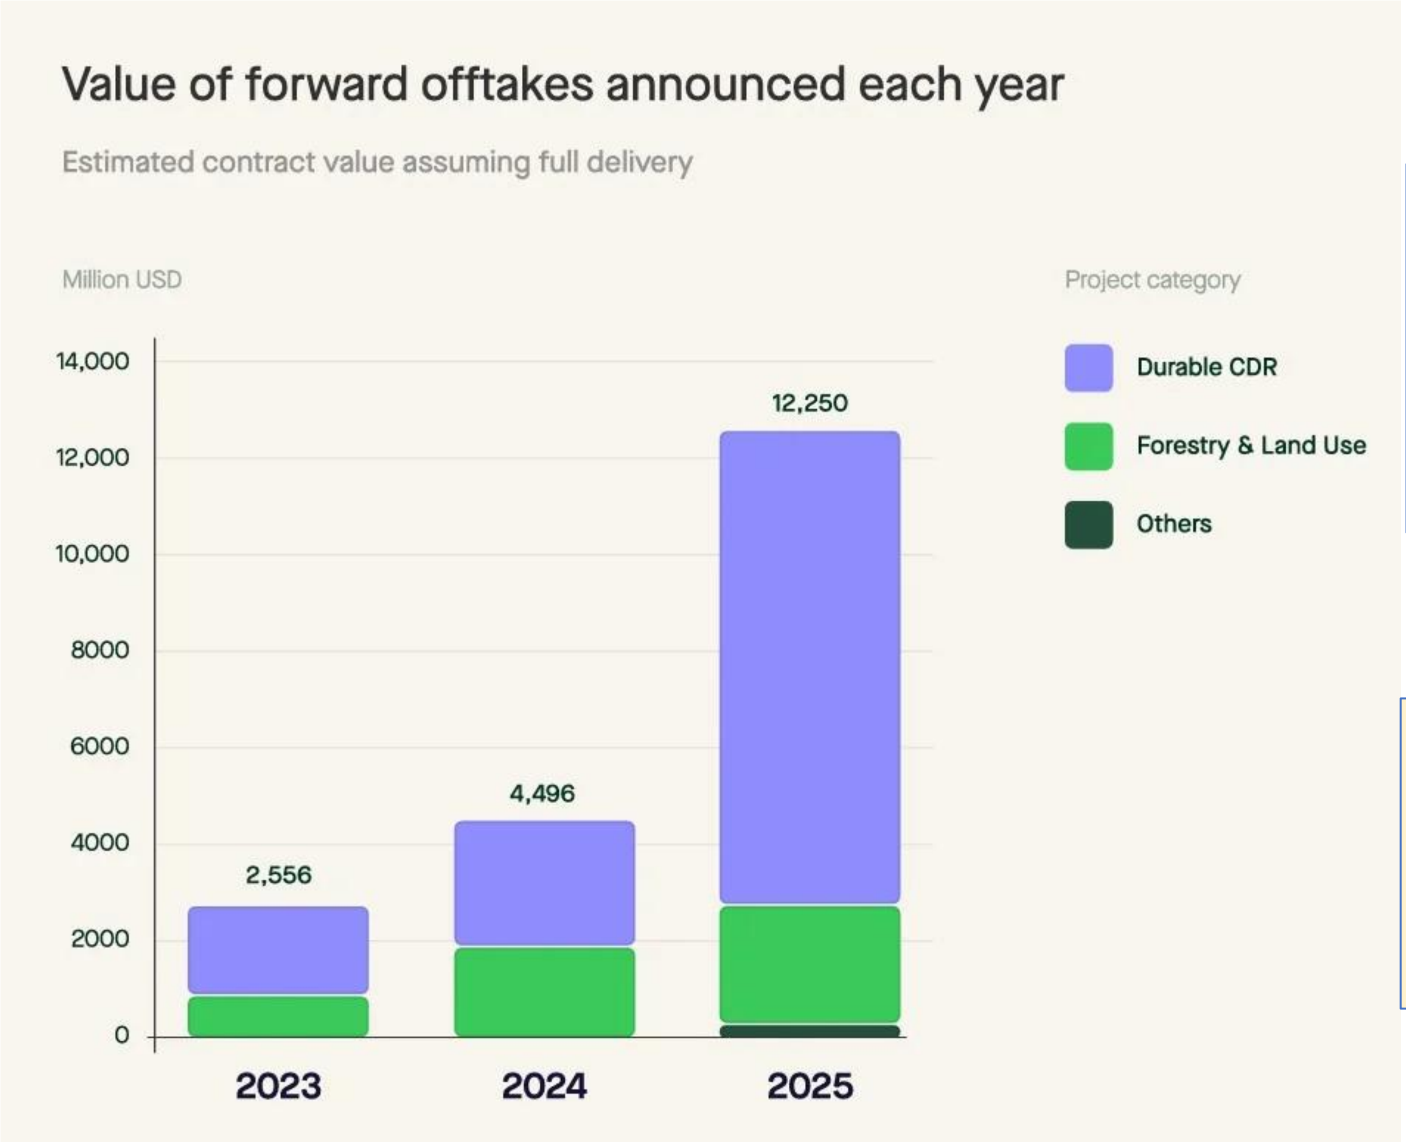
CARBON CREDIT OFFTAKES SURGE IN 2025

Offtake agreements became one of the strongest signals in the carbon credit market in 2025. While spot market activity slowed, long-term commitments surged

This growth did not come from higher volumes, total credits amount to roughly 78 million tonnes, spread across many years. On average, about 10 million credits per year through 2035

DURABLE CDR HAS DOMINANT SHARE IN 2025 CARBON CREDIT OFFTAKES



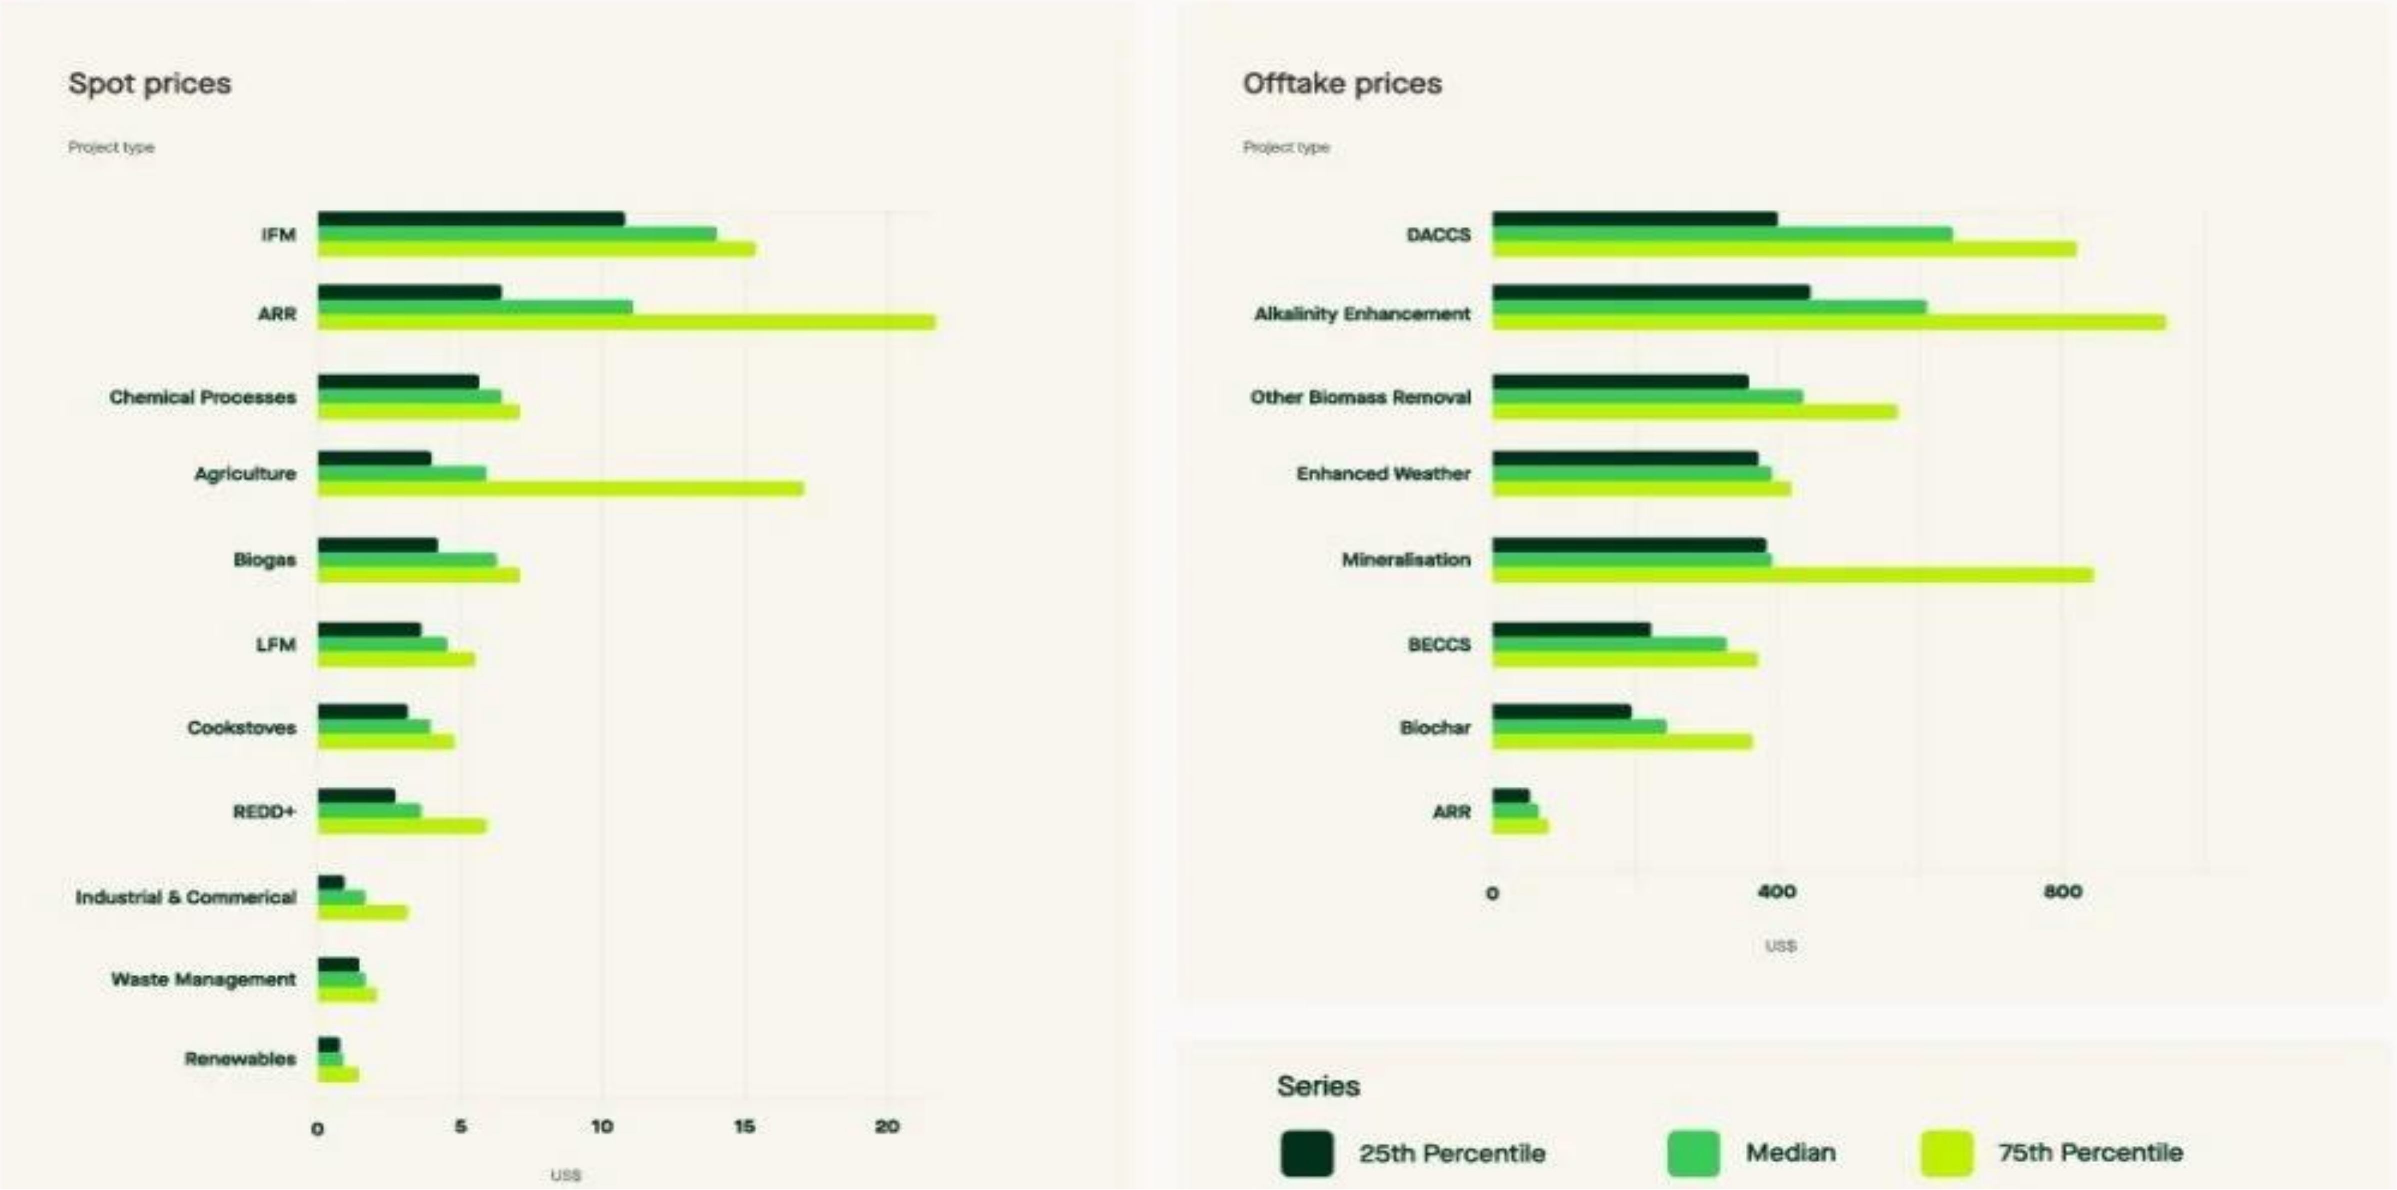
The forward market is not about scale today. It is about securing future supply that meets higher standards.

Buyers are targeting specific credit types with strong integrity signals, eg durable CDR

The weighted average price implied by offtake deals in 2025 was around $160 per credit.

This is far above the spot market average of roughly $6 per credit.

PRICE DISTRIBUTION BY PROJECT TYPE: OFFTAKES COMMAND HIGH PREMIUM



Why Buyers Are Willing to Pay a Premium Upfront

•**Carbon removals dominate offtake deals:** Most credits covered by offtake agreements are carbon removal credits, not avoidance credits. These include **Direct Air Capture, Biochar, BECCS**, and **Mineralization**.

•**Net-zero targets drive long-term planning:** Companies face growing pressure to meet net-zero goals. Many now acknowledge that emissions cuts alone will not eliminate all emissions. They expect to use removals to address residual emissions in the 2030s and beyond.

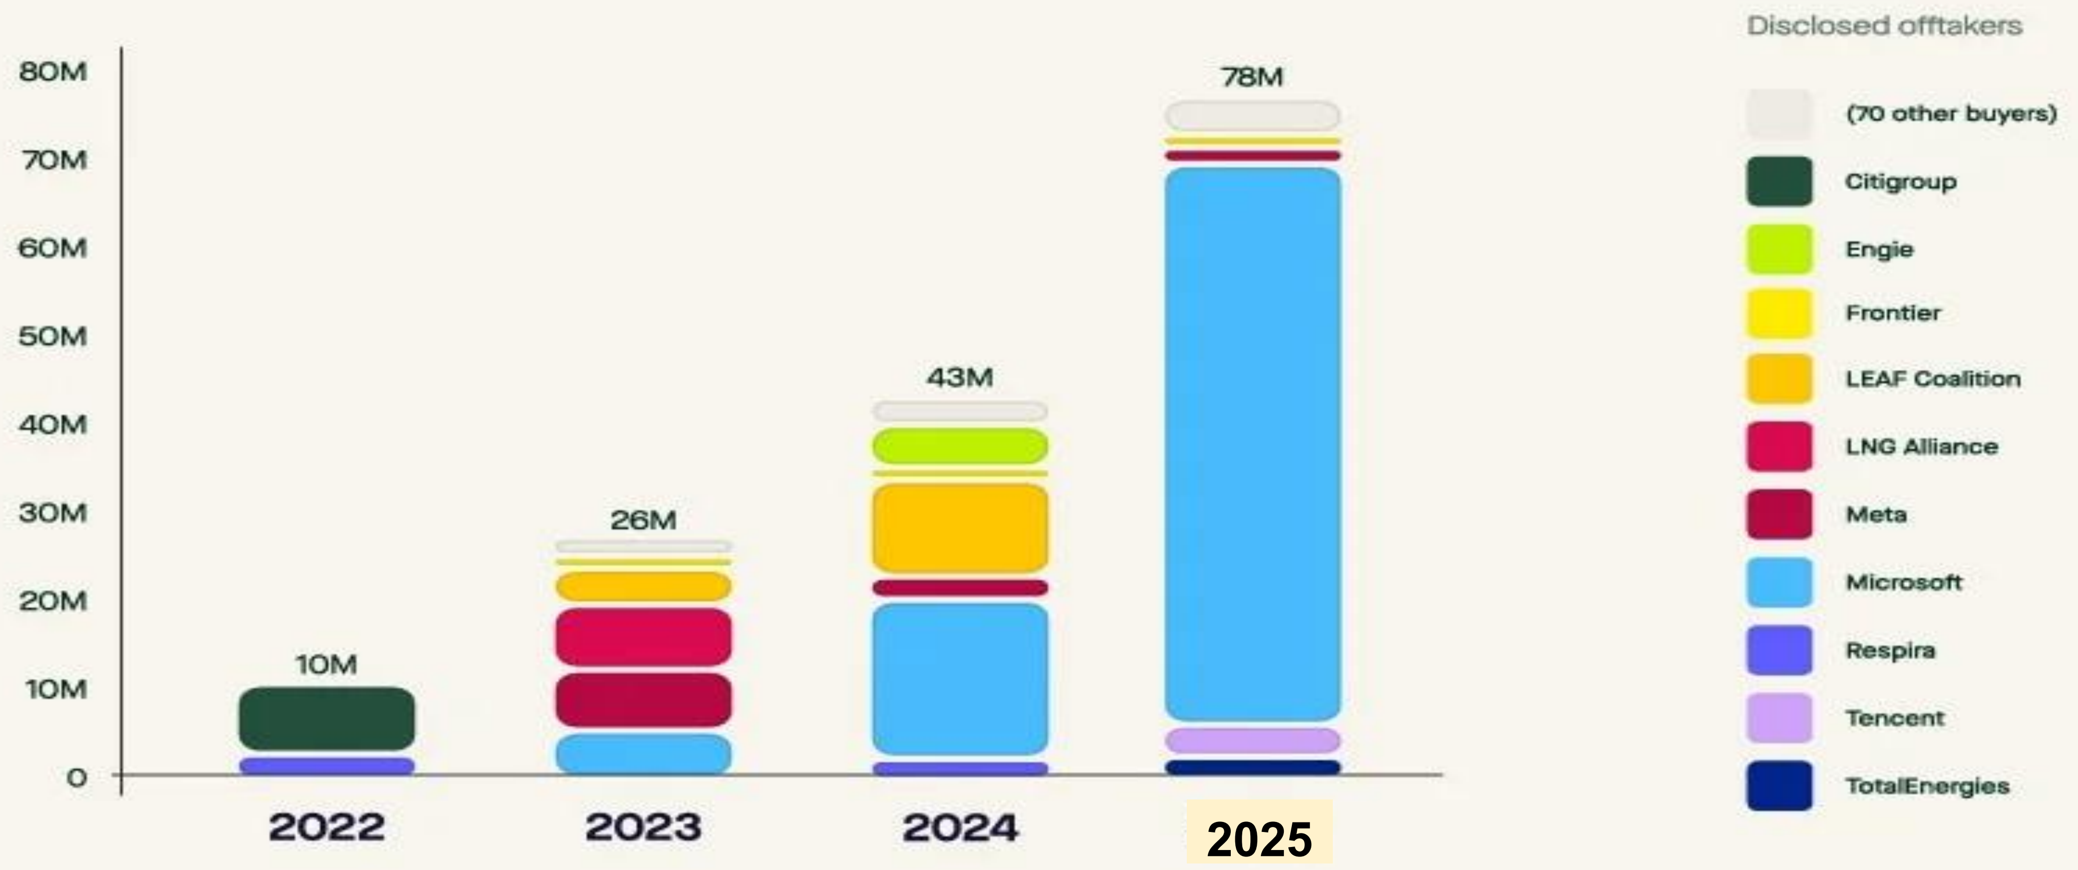
•**Future supply remains uncertain:** Few carbon removal projects operate at a commercial scale today. Offtake agreements help buyers reduce exposure to future shortages and price spikes.

•**Policy signals reinforce buyer behavior:** The expansion of compliance markets point to rising demand for high-integrity credits. Buyers anticipate stronger competition for a limited supply.

As a result, buyers accept high prices today to manage future risk.

Prices reflect expected scarcity, not current market conditions.

OFFTAKE VOLUMES ANNOUNCED – IN PAST 4 YEARS



A small group of buyers accounted for most of the 2025 volume. Microsoft dominated the durable carbon removal market, accounting for 85% of the total durable removal offtake volume in 2025
